

Design out the box

Sky Cycle Lanes

CONTEXT

London is among a range of UK cities considering proposals for elevated bike paths. Architect Norman Foster unveiled plans to create a 220 km car-free cycle network around the city and surrounds. The city has already introduced a network of cycle superhighways on roads.

This is an extremely ambitious plan for 220 km (136 miles) of elevated bike track, lofted over existing railway lines. This is the most comprehensive of all the schemes, and would completely overhaul London's transportation system

DESIGN TASK

Chester city council have received substantial government funding to be a trial city for a new revolutionary sky cycle. The new system should replace all remaining cars in the city centre. It must have multiple drop off zones and allow people to travel to key locations all over the city.
